1 Assignment summary

2 Problem one

We choose to create an Index file every time an user requests a directory. This way we have index links to the files in that directory to help with the navigation and it looks good. But if the user ask for a file/directory that doesn't exist on the server we send back a 404(File not found).We also link to our secret folder in this main index but if we click on it we get an 403 (access denied).

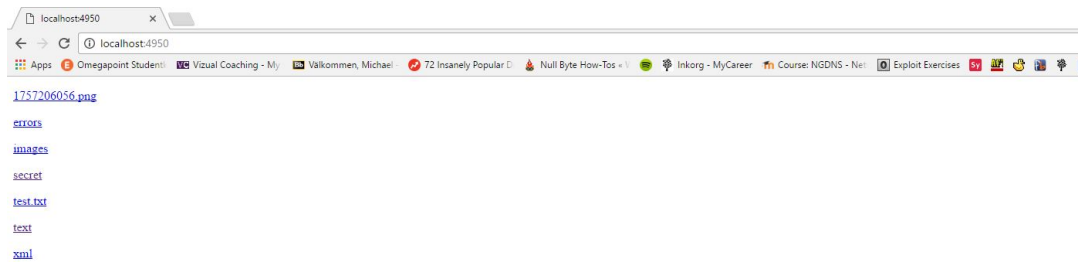

Figure 2.1: GET request on a directory, responds with index.html

Figure 2.2: GET request on a HTML file

Figure 2.3: GET request on an image
